                                                                                                                                                                                                                                                                                      CC This invention describes a novel method for determining the degree of cc methylation of a particular cytosine in a motif 5'-CpG-3', present in a cci genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic CC The amplicon is hybridised to two classes, each with at least one cc member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers can the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method cc classes of oligomers, the degree of methylation is calculated. The method cc is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders components etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. AB031410-AB054121 represent genomic DNA sequences used to illustrate the cc methylation for determining the degree of cytosine methylation described in cc the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a CC genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CD DNA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one CC member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the CC label on the amplicon. From the ratio of labels hybridised to the two CC classes of oligomers, the degree of methylation is calculated. The method CI is used: (1) for diagnosis and/or prognosis of side effects of CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide CC systems etc., particularly by detecting mutations or single nucleotide CC systems etc., particularly by detecting mutations of cell or tissue CC types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. CR ABO13410-ABO54121 represent genomic DNA sequences used to illustrate the CC methylation of the invention.
                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS care used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the cells ame genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production optential of the microorganisms to be improved. New genes may be cell discovered, possible functions of unknown open reading frames can be comploided and gene copy number variation and stability can be considered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway
                                                                                    Query Match

                                                                     Matches
                                                                                                                                                                                        engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Fusarium venenatum; AAF11248 to AAF11853 represents ESTs from Aspergillus oryzae; and AAF11854 to AAF14878 represents ESTs from Aspergillus oryzae; and AAF14879 to AAF15337 represents ESTs from Trichoderma reesei, which are

CC The invention discloses an isolated 25206 polypeptide, a human CC short-chain dehydrogenase/reductase (SDR) family member. Members of this CC family catalyse the reversible, rate limiting conversion of retinol to CC retinal. Retinal is then converted to retinolc acid which plays a key CC role in the regulation of embryonic development, spermatogenesis and CC epithelial differentiation. Short chain dehydrogenases are important in CC the metabolism of small molecules, production/removal of biologically CC important molecules that modulate development and growth, elimination of CC conditions. The polynuclectide and polypeptide are useful for identifying CC compounds which binds to them, for identifying compounds which binds to them, for identifying compounds which binds to them, for identifying compounds which modulate CC the activity of the polypeptide in a sample, for modulating aberrant activity of the polypeptide in a sample, for modulating aberrant activity CC of 25206-expressing cells (e.g. a cancerous, pre-cancerous or neural CC aberrant activity. The 25206 molecules can act as diagnostic targets and CC therapeutic agents for controlling one or more cellular proliferative, CC including haematopoietic disorders, or differentiative disorders (e.g. cancer, tumours, carcinoma, sarcoma and Hodgkin's disease, parkinsonism CC and progressive supranuclear palsy) and reproductive disorders (e.g. CC polycystic ovarian disease and ovarian tumours). The sequence presented CC is the human short-chain dehydrogenase/reductase, 25206, cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; gene; ss; cytostatic; nootropic; neuroprotective; antitumour; 25206; short-chain dehydrogenase; short-chain reductase; SDR; retinol; retinol; retinol acid; embryonic development; spermatogenesis; epithelial differentiation; metabolism; development; growth; proliferative disorder; haematopoletic disorder; cancer; tumour; differentiative disorder; carcinoma; sarcoma; Hodgkin's disease; neurodegenerative disorder; Alzheimer's disease; Parkinsonism; progressive supranuclear palsy; reproductive disorder; ovarian tumours; polyvestic ovarian disease

Appl. Genet. 96:196, 1998) was constructed using the Eco RI site of pECSBAC4. The library consists of 72. 960 clones with an average insert size of 120 Kb, equal to 7 haploid genome equivalents. Screening of the library is done by hybridization of high-density colony filters and/or PCR amplification of DNA pools. Four high density filters, each containing 18.432 clones (doubly spotted), represent the whole library for colony screening 27 c 82 g 333 t 29 others
